Fleck® SoftFlo SE Controller Transition to the New SoftFlo SXT Controller

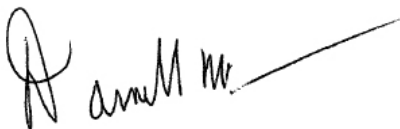

Pentair Water has transitioned most of our Fleck-branded products from the SE to the SXT Controller over the last year. Within the next 60 days, SoftFlo cabinet faceplates will be available in the new SXT Controller configuration.

Starting November 16, 2009, (possibly earlier depending on remaining SE Controller inventory) all SoftFlo cabinet faceplates that ship from Pentair Water with an SE circuit board, will be transitioned to the SXT circuit board. All orders for electronic control valves, intended for use in a SoftFlo Cabinet will be configured to use the SXT Controller electronic package. The new SXT is an updated electronic controller that has additional features versus the standard SE Controller. For example, the SXT Controller offers an intuitive, large backlit display, user-friendly interface, and a capacitor power backup of up to 48 hours. Customers with SE Controller experience will find the SXT Controller easy to understand and program. Since the launch of the SXT Controller, we have received positive feedback from our customers on the SXT's appearance and performance.

If you would like to transition to the SXT Controller earlier than November 16th date referenced above, please contact your Customer Care Representative to update your valve's specifications. For other questions or any special needs, please contact your Sales Manager at your earliest convenience.

Sincerely,

Darnell Wesson, Product Manager
Pentair Residential Filtration Technologies
